

# Adapter

Type: Structural

#### What it is:

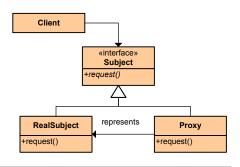

Convert the interface of a class into another interface clients expect. Lets classes work together that couldn't otherwise because of incompatible interfaces.

# Proxy

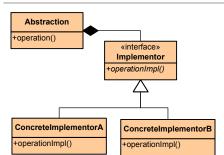

Type: Structural

### What it is:

Provide a surrogate or placeholder for another object to control access to it.

Client

# Bridge

Type: Structural

#### What it is:

Decouple an abstraction from its implementation so that the two can vary independently.

What it is:

Type: Creational

Provides an interface for creating families of related or dependent objects without specifying their concrete class.

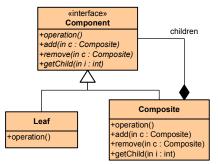

Abstract Factory

+createProductA() AbstractProduct +createProductB() ConcreteFactory ConcreteProduct +createProductA()

«interface»

AbstractFactory

+createProductB()

# Composite

Type: Structural

# What it is:

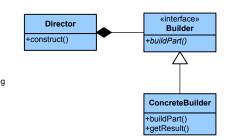

Compose objects into tree structures to represent part-whole hierarchies. Lets clients treat individual objects and compositions of objects uniformly.

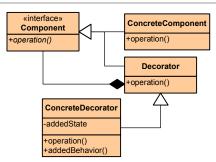

# Builder

Type: Creational

#### What it is:

Separate the construction of a complex object from its representing so that the same construction process can create different representations.

# Decorator

Type: Structural

# What it is:

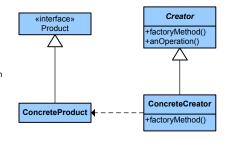

Attach additional responsibilities to an object dynamically. Provide a flexible alternative to sub-classing for extending functionality.

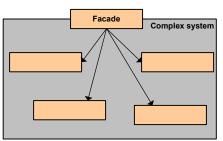

Type: Creational

Factory Method

What it is:

Define an interface for creating an object, but let subclasses decide which class to instantiate. Lets a class defer instantiation to subclasses.

# Facade

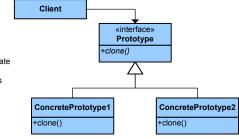

Type: Structural

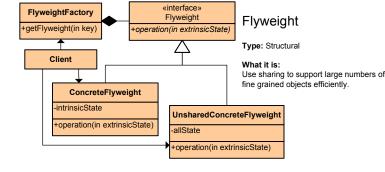

Provide a unified interface to a set of interfaces in a subsystem. Defines a highlevel interface that makes the subsystem easier to use.

Prototype

Type: Creational

Specify the kinds of objects to create using a prototypical instance, and create new objects by copying this prototype.

# Singleton

Type: Creational

# What it is:

Ensure a class only has one instance and provide a global point of access to it.

# Singleton -static uniqueInstance -singletonData

+static instance() +SingletonOperation()
